Before ExhaustShield

Ungoverned AI — employees send company data straight to the public cloud.

THE OLD MODEL: Shadow AI

Convenient for users · invisible and risky for the enterprise

What employees do today

- Open ChatGPT, Groq, Claude, or Copilot in a browser.
- Paste policy text, deal names, salaries, and API keys.
- No scanner, no confirm step, no audit of what left.
- Every team picks its own tool — no single choke point.

Why security loses sleep

- **Data leak** — prompts live on vendor servers.
- **Wrong audience** — anyone can ask anything.
- **Guesswork** — models invent policy instead of reading files.
- **No proof** — audits cannot show who sent what.

Real-world leak scenarios (no gate today)

Scenario	What gets pasted	Why it hurts
HR question	Salary bands, employee IDs, termination notes	PHI/PII stored on vendor servers forever
Sales prep	Deal names, pricing, customer contracts	Competitive intelligence leaves the building
Engineering debug	API keys, stack traces, internal URLs	Credentials may enter model training pipelines

Bottom line

Public AI feels productive until a secret, salary, or customer name hits the vendor cloud. Policy slides are not a control — you need a **technical door** that scans, routes, and logs every prompt.

After ExhaustShield — Live

One dashboard for company policy search and generic AI chat — every prompt scanned first.

THE NEW MODEL: Control plane + AI

Employees chat here · gateway decides what may leave · everything is logged

One dashboard — policy search and AI chat

Employees stop switching between SharePoint and ChatGPT. **One login, one screen** — company policy search **and** generic AI chat, both behind the same security gate and audit trail.

Tab 2 · Company knowledge

Policy & doc questions — HR rules, deal facts, acquisitions.

Searches local files on this machine.

Answers from documents — **no outside LLM**.

Tab 3 · Outbound Gate

Generic AI chat — drafts, summaries, brainstorming.

Same gate scans every prompt before it leaves.

Safe / Medium / High routing — **ChatGPT with rules**.

Employees → ExhaustShield Dashboard

One front door · Tabs 1–5

↓

GATE: Detect secrets → Route lane

Tab 2 policy + Tab 3 chat use same gate

↓

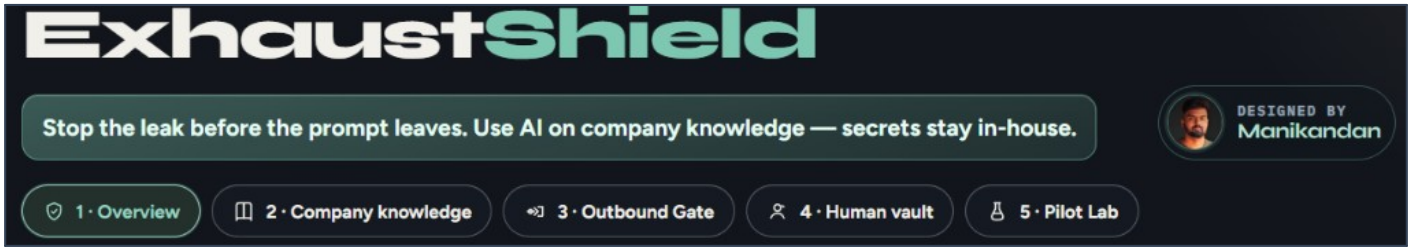

SAFE	MEDIUM	HIGH	LOCAL
Outside AI (after confirm)	Scrub first then outside	Private Ollama never external	Docs / human no outside LLM

ChatGPT convenience — with enterprise rules

Four routing lanes

Lane	When it applies	Where it goes
SAFE	No secrets in the prompt	Groq after you confirm
MEDIUM	Company names, deal amounts	Scrubbed text only → Groq
HIGH	Keys, PHI, employee IDs	Private Ollama — never external
LOCAL	Policy doc keyword match	Local files or human vault

Five dashboard tabs

Same dashboard — Tab 2 for policy docs, Tab 3 for AI chat. Safe/Medium prompts can still reach outside AI after confirm or scrub.
